

The Hair Line[®]

A comprehensive publication bringing you the latest procedures and technologies in hair restoration.

After years of excessive eyebrow trimming as a teenager, my eyebrows just stopped growing. Since then, I had been using make-up to cover up my eyebrow hair loss. Makeup was not very convenient because it washed off so easily and made it extremely difficult to do activities such as swimming.

When I heard that Dr. Quatela was offering hair transplants in the eyebrow area, I was absolutely thrilled. I couldn't have been happier to hear that there was finally a solution for my hair loss. I didn't even know it existed!

Dr. Quatela and his team did a wonderful job and I highly recommend this procedure to anyone who suffers from eyebrow loss.

I immediately scheduled my appointment with Dr. Quatela and went ahead with the procedure. It was fairly painless.

The only thing I felt was a little pressure when the hair was being placed. I actually slept through most of it.

Dr. Quatela emphasized that the hair would initially fall out but would eventually grow back again. I am currently three months out and have only lost a few hairs. I am so happy with the results of my eyebrow transplants. They are completely full and could not look more natural. No one would ever know they weren't original!

Did You Know?

A study published in the *Biology of Reproduction Journal* determined that equol, a molecule created when soy is digested, naturally blocks DHT (dihydrotestosterone), a male hormone responsible for hair loss. This study suggests that the powerful effects of equol may have an important role in the treatment of hair loss.

New Angle on Hair Transplants

by Vito C. Quatela, MD

Lateral Slit Hair Transplantation

At the Quatela Center, we strive to offer the most effective and innovative methods in hair transplantation. Our most recent advance is the Lateral Slit Technique. This method, which refers to the technique that a surgeon uses to prepare the site for the transplanted hair, enables our team of experts to closely pack the hair grafts together with more control over the angle and direction in which new hairs will grow. The greatest benefit of this procedure is

that we will be able to have individuals receive nearly double the hair grafts in one session, approximately 2,000 to 2,500, depending on the baldness pattern and extent of balding.

A Revolutionary Technique

The Lateral Slit Technique is innovative in the sense that it allows us to utilize the latest in "micro-surgical" blades paired with smaller hair grafts and smaller incisions. Using these highly refined tools, our team is able to recreate the natural direction and pattern of hair in the balding areas using extremely tiny angular slits, rather than the more common sagittal slits. This results in an incredibly refined micro follicular unit hair transplant that provides optimal fullness and naturalness. Patients interested in this procedure can expect a rapid healing process and no skin distortion.

Eyebrow Transplants

More Than Meets The Eye

Hair restoration techniques have improved dramatically in recent years and have reached the point where transplanted hair is indistinguishable from natural hair. These improvements have encouraged us to venture away from the scalp and onto the eyebrow. The Quatela Center for Hair Restoration is pleased to announce that we will be combining state-of-the-art techniques and our medical teams artistic talent to help provide yet another solution to hair loss: eyebrow transplants.

Eyebrow loss occurs for a multitude of reasons; including genetics, excessive plucking, disease and physical trauma. Eyebrow thinning or loss can have a significant impact on an individual's total appearance, since eyebrows are a key landmark on the face. Eyebrow loss can often have a damaging effect on one's self esteem and personal confidence. Any individual who has partial or complete loss of their eyebrows is possibly a candidate for this procedure.

Attention to Detail

Eyebrow transplants are a technically demanding procedure that involves careful planning. The eyebrow position must be artistically designed and then filled in with single hair grafts. The grafts must be meticulously placed at specific angles and directions of growth in order to mimic the natural eyebrow.
